## Summary

## Device for Die-Cutting a Stack of Sheet-like Materials

The invention concerns a device for die-cutting a stack of sheet-like materials, particularly labels, whereby the stack is pressed into the die-cutter blade by a relative movement of a punching ram and a hollow cylindrical die-cutter blade.

In such a device, a frame 16 with clamping elements 17 mounted in, and adjustable and lockable relative to the frame 16, is provided for fixation of the die-cutter blade 18, and also an adjusting element 70, 72 mounted in the frame 16 is provided for aligned orientation with a minimum of one orientation edge of the adjusting element 70, 72 with one knife edge section 69 of the diecutter blade 18 prior to fixation of the adjusted clamping elements 17.

Pre-adjustment of the die-cutter blade, for the purpose of optimal positioning to the stack to be punched, is ensured in a die-cutting device of this type.
